

## **Q1)What is abstraction in Java?**

We know what object do but don't know how. -Data Hiding. -Using abstract class and interface we can achieve. In abstraction we are hide a logic in between method. -'abstract' keyword is used. -hiding implementation details and showing only what is necessary. -Interface supports 100% abstraction.

## **Q2)What is an abstract class?**

We cannot create objects of abstract classes. -we use abstract keyword to declare an abstract class. -an abstract class can have both the regular methods and abstract methods. -a method that doesn't have its body is known as an abstract method. -we can access members of the abstract class using the object of the subclass. -It abstract class includes any abstract methods,then all the child classes inherited from the abstract superclass much provide the implementation of abstract method.

## **Q3)What is an interface in Java?**

using 'interface' keyword we can create interface. -Interface is a contract between class and methods. -Interface can contain static ,default and abstract method. -by default any method is public abstract. -By default any data member is public static final -we can extends interface with other interface using 'extends' keyword . -using interface we can achieve multiple inheritance,abstraction in java. -'implement' keyword is used for override methods from interface.

## **Q4)Difference between abstract class and interface.**

### **Abstract Class**

- 1.Declared using the abstract keyword.
- 2.Can contain abstract and non-abstract methods.
- 3.Can have instance variables, static variables, and final variables.
- 4.Constructors are allowed.
- 5.Methods can use private, protected, default, and public access modifiers.
- 6.Supports single inheritance only.
- 7.Uses the extends keyword for inheritance.
- 8.Object of abstract class cannot be created directly.
- 9.Provides code reusability.
- 10.Faster than interface.

### **Interface**

- 1.Declared using the interface keyword.
- 2.All methods are abstract by default.
- 3.Variables are public static final by default.
- 4.Constructors are not allowed.
- 5.Methods are public by default.
- 6.Supports multiple inheritance.
- 7.Uses the implements keyword for inheritance.
- 8.Object of interface cannot be created directly.
- 9.Used to achieve 100% abstraction (before Java 8).

## **Q5)What is a constructor?**

1. A constructor has the same name as the class.
2. It does not have a return type, not even void.
3. It is called automatically when an object is created using new
4. Used to initialize data members of a class.
5. A constructor can be public, protected, or default (not private for object creation).
6. Constructors can be overloaded.
7. A class can have more than one constructor.
8. If no constructor is written, Java provides a default constructor.
9. Constructors are not inherited.

## **Q1)Write a program to count the number of digits in a number.**

```
import java.util.Scanner;
public class CountDigits {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter a number: ");
        int n = sc.nextInt();

        int count = 0;

        if (n == 0) {
            count = 1;
        } else {
            while (n != 0) {
                count++;
                n = n / 10;
            }
        }
        System.out.println("Number of digits: " + count);
    }
}
```

## **Output:-**

Enter a number: 1234

Number of digits: 4

## **Q2)Write a program to find the greatest common divisor (GCD).**

```
import java.util.Scanner;

public class GCD {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter first number: ");
        int a = sc.nextInt();

        System.out.print("Enter second number: ");
        int b = sc.nextInt();

        while (b != 0) {
            int temp = b;
            b = a % b;
            a = temp;
        }
        System.out.println("GCD is: " + a);
    }
}
```

### **Ouput:-**

Enter first number: 123

Enter second number: 11111

GCD is: 41

## **Q3)Write a program to calculate LCM of two numbers.**

```
import java.util.Scanner;

public class LCM {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter first number: ");
        int a = sc.nextInt();

        System.out.print("Enter second number: ");
        int b = sc.nextInt();

        int x = a, y = b;

        while (a != b) {
            if (a > b)
                a = a - b;
            else
                b = b - a;
        }
        System.out.println("LCM is: " + (x * y));
    }
}
```

```

        b = b - a;
    }

    int gcd = a;
    int lcm = (x * y) / gcd;

    System.out.println("LCM is: " + lcm);
}
}

```

## **Output:-**

Enter first number: 111

Enter second number: 1111

LCM is: 123321

## **Q4)Write a program to check if a year is leap year.**

```

import java.util.Scanner;

public class LeapYear {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter a year: ");
        int year = sc.nextInt();

        if ((year % 4 == 0 && year % 100 != 0) || year % 400 == 0) {
            System.out.println("Leap Year");
        } else {
            System.out.println("Not a Leap Year");
        }
    }
}

```

## **Output:-**

Enter a year: 2001

Not a Leap Year

## **Q5)Write a program to print all even numbers between 1 and 50.**

```
import java.util.Scanner;

public class EvenNumber {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter the limit: ");
        int n = sc.nextInt();

        for (int i = 1; i <= n; i++) {
            if (i % 2 == 0) {
                System.out.print(i + " ");
            }
        }
    }
}
```

## **Output:-**

Enter the limit: 50

2 4 6 8 10 12 14 16 18 20 22 24 26 28 30 32 34 36 38 40 42 44  
46 48 50

## **Q6)Write a program to calculate power of a number.**

```
import java.util.Scanner;

public class PowerNumber {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter base: ");
        int base = sc.nextInt();

        System.out.print("Enter exponent: ");
        int exp = sc.nextInt();
        int result = 1;

        for (int i = 1; i <= exp; i++) {
            result = result * base;
        }
        System.out.println("Power is: " + result);
    }
}
```

```
    }  
}
```

## **Output:-**

Enter base: 126

Enter exponent: 122

Power is: 0
